Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 4
D72175
CSP protein - variola minor virus (strain Garcia-1966)
C;Species: variola minor virus (cspecies: variola minor virus
C;Species: variola minor virus
C;Date: 24-Nov-1999 #sequence_revision 24-Nov-1999 #text_change 20-Jun-2000
C;Accession: D72175
R;Shchelkunov, S.N.; Totmenin, A.V.; Gutorov, V.V.; Safronov, P.F.; Massung, R.F.; I Sybmitted to GenBank, March 1998
A;Description: Analysis of the complete coding sequence of DNA of alastrim variola n A;Reference number: A72150
A;Accession: D72175
A;Atatus: preliminary
A;Molecule type: DNA
                                                                                                                                                                    Gispecies: Mus musculus (house mouse)

A60771
B-cell activation protein CD40 precursor - human
N;Alternate names: B-cell surface antigen Bp50
C;Species: Homo sapiens (man)
C;Date: 03-Jun-1993 sequence_revision 03-Feb-1994 #text_change 21-Jul-2000
C;Accession: 504460; A60771

-I FUNCTION: RECEPTOR FOR TNF-ALPHA. HIGH AFFINITY FOR TNA-ALPHA AND APPROXIMATELY 5-FOLD LOWER AFFINITY FOR THE BETA.

-I SUBCELLULAR LOCATION: Type I membrane protein.

-I FTM: PHOSPHORYLATED; MAINLY ON SERINE RESIDUES WITH A VERY LOW LEVEL ON THREONINE RESIDUES.

-I PHARMACEUTICAL: Available under the name Enbrel (Immunex and Wyeth-Ayerst). Used to treat moderate to servere rheumatoid arthitis (RA). Enbrel consist of the extracellular ligand-binding portion of TNRF2 linked to an Immuglobulin Fc chain. It binds to TNF-alpha and blocks its interactions with receptors.
                                                                                                                                      CHARACTERIZATION.

McFadden G., Goodwin R.G.;

"T2 open reading frame from the Shope fibroma virus encodes a soluble form of the TNF receptor.";

Biochem. Biophys. Res. Commun. 176:335-342(1991).

-! FUNCTION: BINDS TO TNF-ALPHA AND BETA. PROBABLY PREVENTS TNF TO REACH CELLULAR TARGET AND THERBEY DEAMPENING THE POTENTIAL ANTIVIRAL EFFECTS OF THE CYTOKINE.

-! SIMILARITY: CONTAINS 4 TNFR-CYS REPEATS.

Protein Sci. 7:1124-1135(1998).

-! FUNCTION: RECEPTOR FOR A CYTOKINE LIGAND KNOWN AS CD40L.

-! SUBCELLULAR LOCATION: Type I membrane protein.

-! TISSUE SPECIFICITY: B-CELLS AND IN PRIMARY CARCINOMAS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

C FUNCTION: RECEPTOR FOR RANK LIGAND (RANKL, ALSO KNOWN AS CSTEOCLAST DIFFERENTIATION FACTOR OR ODF), ESSENTIAL FOR RANKL-MEDIATED OSTEOCLASTOGENESIS. INVOLVED IN THE REGULATION OF INTERACTIONS BETWEEN T-CELLS AND DENDRITIC CELLS.
C INTERACTIONS BETWEEN T-CELLS AND DENDRITIC CELLS.
TISSUE SPECIFICITY: UBIQUITOUS EXPRESSION WITH HIGH LEVELS IN TRABECULAR BONE, THYMUS, SMALL INTESTINE, LONG, BRAIN AND KIDNEY.
WEAKLY EXPRESSED IN SPLEEN AND BONE MARROW.
C VILLARITY: CONTAINS 4 THER-CYS REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Galibert L.;

C. I. FUNCTION: LOW AFFINITY RECEPTOR WHICH CAN BIND TO NGF, BDNF, NT-3, AND NT-4. CAN MEDIA E CELL SURVIVAL AS WELL AS CELL DEATH OF NEURAL CELLS (By similarity).

C. I. SUBMURIT: CAN FORM A HOWODIMER THROUGH DISULFIDE BOND FORMATION.

C. I. SUBMURITY: CONTAINS 4 TNFR-CYS REPEATS.

C. I. SIMILARITY: CONTAINS 1 DEATH DOMAIN.

                                                                                      FUNCTION: RECEPTOR A CYTOKINE LIGAND KNOWN AS CD30L. MAY PL. A ROLE IN THE REGULATION OF CELLULAR GROWTH AND TRANSFORMATION ACTIVATED LYMPHOBLASTS. REGULATES GENE EXPRESSION THROUGH ACTIVATION OF NFKB.
                                                                                                                                                         SUBCELLULAR LOCATION: Type I membrane protein.
ALTERNATIVE PRODUCTS: A SHORTER CYTOPLASMIC FORM (C30V) WHICH
ONLY EXPRESSED IN ALVEOLAR MACROPHAGES IS PRODUCED BY THE USE
OF AN ALTERNATIVE INITIATION CODON IN THE SAME READING FRAME.
PTM: PHOSPHORYLATED ON SERINE AND TYROSINE RESIDUES.
DISEASE: MOST SPECIFIC HODGKIN'S DISEASE ASSOCIATED ANTIGEN.
SIMILARITY: CONTAINS 6 TWRR-CYS REPEATS.
DATABASE: NAWE-PROW; NOTE-CD guide CD30 entry;

                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                    The sequence was deduced from a DNA sequence obtd. from a clone isolated from a library prepd. from a human fibroblast cell line, WI-26 VA4 (ATCC CCL 95.1). The clone is deposited as Accession No. 68088 under the name pCAV/NOT-TNF-R. The DNA can be truncatd to produce sequences which express soluble receptor comprising residues 1-235, 1-185 or 1-163 of the protein.

The Inker may comprise 5-100 amino acids selected from Gly, Asp, Ser, Thr and Ala. These linkers separate the individual moeities by such a distance that each component of the fusion protien moeities capable of folding into the secondary or tertiary structure required for its biological activity. These fusion proteins may be used in therapy, diagnosis and assays for conditions madiated by TNF or IL-1, particularly in conditions in which both TNF and IL-1 play a causitive role. They may be used to treat cachexia, rheumatoid arthritis, creebral malaria, allograft and xenograft rejection in graft verses host disease, sepsis, septic shock, inflammation, allergies and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequences given in AAR42058-59 repressent human tumour necrosis factor receptor (TNF-R) and the sequences in AAR42060-61 represent human interleukin-1 receptor (IL-1R). These sequences were used in the production of a fusion protein which conformed to one of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New fusion protein tumour necrosis factor and human interleukin-1

The present sequence encodes human tumour necrosis factor family receptor (TMF-RII) polypeptide. The specification describes a TMF receptor designated TR1. An agonist to the TR1 receptor lauseful for inhibiting tumour growth, to stimulate human cellular proliferation, to regulate immune response and antiviral response, to protect against the effects of ionising radiations, to protect against chlamydia infections, to regulate growth, and to treat immunodeficiencies such as in human immunodeficiency virus (HIV). An antagonist to the TR1 receptor is useful for treating T-cell mediated autoimmune diseases, acquired immunodeficiency syndrome (AIDS), septic shock, cerebral malaria, graft rejection, cytotoxicity, cachexia, apopticsis, and inflammation. TR1 polynucleotides and polypeptides, and TR1 agonists and antagonists are useful for treating cancers, cardiovascular diseases, inflammatory diseases, atherosclerosis, diabetes mellitus, neurological disorders, autoimmune diseases, for promoting angligogenesis, for treating allergy, for wound healing, for regulating bone formation and for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
